No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       US-09-955-526-4

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               qq
                                                                                                                                          The present invention relates to coding sequences (see AAF44740-F44840 and AAF448441) and proteins (see AAB65714-B65814) involved in programmed cell death (PCD; apoptosis). The coding sequences and proteins of the present invention are useful for modulating a PCD or cell death pathway and various developmental pathways in a forestry plant, by stably incorporating one of the present coding sequences into the genome of the forestry plant, where the coding sequence provides a PCD pathway that is not present in a native form of the forestry plant.

The present invention relates to coding sequences (see AAF44740-F44844) and AAF44443-F44844) and proteins (see AAB55714-B65814) involved in programmed cell death (PCD; apoptosis). The coding sequences and proteins of the present invention are useful for modulating a PCD or cell death pathway and various developmental pathways in a forestry plant, by stably incorporating one of the present coding sequences into the genome of the forestry plant, where the coding sequence provides a PCD pathway that is not present in a native form of the forestry plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 WNIGGLLTTMACMGSMVWLLSAPPYQEQKRVALLMAAALFEGASIGPLIELGINFDPSIV 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to proteins derived from bovine mammary gland cells. The invention is useful for stimulating bovine mammary gland cell growth and function, inhibiting the growth of various mammary gland cancer cells, inhibiting anglogenesis and vascularization of tumours, or modulating the growth of blood vessels in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                      Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bovine; mammary gland; cancer; tumour; angiogenesis.

Lung cancer associated proteins and polynucleotide sequences, their agonists, and antagonists may have neuroprotective; cytostatic; cardioactive; immunoomodulatory; muscular active general; vulnerary; gastrointestinal general; nephrotropic; antiinfective; gynecological; or antibacterial general; nephrotropic antiinfective; gynecological; or antibacterial protein or polynucleotide sequences. The lung cancer associated polynucleotide sequences may be used for detection of lung cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The proteins may be used to treat

disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds an infectious diseases. Polynucleotide sequences AAF18425 - AAF18433 and peptide AAB58549 are used in the course of the invention for the identification and characterisation of the polynucleotide and protein

suppression of Bax-induced death of yeast cells transformed to express human Bax. A human HepG2 CDNA library was used for library corpress human Bax. A human HepG2 CDNA library was used for library screening. The liventhon provides vectors, optionally expression or viral vectors, containing BI nucleic acids, and host cells containing these vectors. The nucleic acids encoding BI-LMI-2 can be used to increase expression of these proteins in cells, or antisense molecules prepared from them used to decrease expression. In these ways, cellular apoptotic activity may be modulated. The member of the Bcl-2 family in biological samples. They are specially useful in assays to identify agents (e.g. another BI or a member of the Bcl-2 family in biological samples. They are especially useful in assays to identify agents (e.g. organic of BI-1/BI-2 with a second protein (e.g. a BI, an anti-BI antibody or a Bcl-2 family protein (e.g. Bax) (claimed)) e.g. in screening of BI-1/BI-2 with a second protein (e.g. a BI, an anti-BI antibody or a Bcl-2 family protein (e.g. Bax) (claimed)) e.g. in screening cativity. The agents can then be contacted with cells to modulate cellular apoptotic activity (claimed). Bax overexpression is sociated with e.g. neuronal cell death due to ischemmia, epilepsy, spinal cord injury, Parkinson's disease and Alzheimer's disease.

Antibodies raised against the BIs and peptides are also useful e.g. to detect/quantify BIs in biological samples.
                                                                                                                                                                                                                                                                                            e.g. to modulate
altering BI-1 or BI-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the amino acid sequence of an inhibitor protein, termed BI-1, of the pro-apoptotic protein Bax. Nucleic acids encoding BI-1 (see AAV59067) and BI-2 (see AAV59068) were identified by
                                                                                                                                                                                                                                                                           Bax inhibitor proteins, BI-1 and BI-2 - useful cellular apoptotic activity or identify agents binding which can modulate apoptotic activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 14; Fig 1; 80pp; English.

Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological diseases

Claim 11; SEQ ID No 4128; 2922pp; English.

treating, prognosing or preventing various ovary and/or breast related disorders. Such conditions include ovarian cancer and breast cancer, and disorders. Such conditions include ovarian cancer and breast cancer, and disorders (e.g., infertility, disorders of pregnancy, anovulation, oplycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine calsorders, infections (e.g., chlamydia, HTV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, cophoritis and vaginitis), immune disorders (e.g., congenital and acquired immunodeficiencies, autoimmune opphoritis, systemic lupus erythematosus), cophoritis, systemic lupus erythematosus), cophoritis, systemic lupus erythematosus), cophoritis, systemic lupus erythematosus), cophoritis and disorders, neurological disorders, gastrointestinal disorders and uninary system disorders. Ovarian antigen polypeptides and cophoritis and promopounds which modulate ovarian antigen expression or activity. The polynucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the cophorities may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present ABP43228) and to cDNAs encoding them (ABD54131-ABD56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynucleotides, antibodies against human ovarian antigens, and the use of ovarian antigens, and the use of ovarian antigen polynucleotides and polypeptides in diagnosing, in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO The invention relates to 2175 novel human ovarian antigens (ABP41054ftp.wipo.int/pub/published_pct_sequences.

The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and the proteins are useful in genetic vaccination, testing and the proteins are useful and an analysments. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention.

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                    probable membrane protein YNL305c - yeast (Saccharomyces cerevisiae)
N.Alternate names: hypothetical protein N0405
C.Species: Saccharomyces cerevisiae
C.Species: Saccharomyces cerevisiae
C.Date: 27-Apr-1996 #sequence_revision
C.Accession: 563281; 566127
R.Maurer, C.T.C.** Urbanus, J.H.M.; Planta, R.J.
Submitted to the Protein Sequence Database, April 1996
A.Recession: 563281
A.Accession: 563281
A.A.B.Cossion: 563281
A.A.Coss-references: EMBL: 271581; NID:g1302402; PID:g1302403; MIPS:YNL305c
A.Experimental source: strain S288C

Mol. Biol. Cell 1:337-346(1998).
-!- FUNCTION: SUPPRESSOR OF APOPTOSIS.
-!- SUBGELLULAR LOCATION: Integral membrane protein (Potential).
-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).
-!- TISSUE SPECIFICITY: HIGHLY ABUNDANT IN TESTIS.
-!- SIMILARITY: BELONGS TO THE BII FAMILY.

"Liver CDNA from Japanese flounder with similarity to TEGT.";

"Liver CDNA from Japanese flounder with similarity to TEGT.";

Submitted (Jah-2000) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: SUPPRESSOR OF APOPTOSIS (BY SIMILARITY).

-!- SUMCELLULAR LOCATION: Integral membrane protein (Potential).

-!- TISSUE SPECIFICITY: HIGHLY ABUNDANT IN TESTIS.

-!- SIMILARITY: BELONGS TO THE BII FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DIQEIIEKAHLGDMDYVKHALTLFTDFGAVFVRILIIMLKNASEKEEKKK 244
